

Your flat has a MVHR (Mechanical ventilation with Heat Recovery) ventilation system located above your cooker hood.

This means that it controls the air in your home completely by extracting old, moist air from bathrooms and kitchens, recovering heat off the air and moving it to fresh air to supply living areas.

When you take a shower or bath or are drying clothes inside, boost the system.

In order to 'boost' the system, open the cooker hood. It will help to remove humidity from the bathroom to reduce the risk of mould.

Your MVHR is controlled via an on/off switch in the kitchen. It is named 'Cooker Hood'

If this is turned off, you will NOT have ventilation in your flat. This should ALWAYS be on.

Your filters need to be cleaned every 3-6 months.

They are located within your MVHR unit. Turn off the cooker hood switch when accessing the filters.

They can be cleaned by vacuuming or washed with warm water. Leave to dry thoroughly before replacing back in the unit.
